Executive Summary

The 2010/2011 Crop Forecast Survey results indicate that national maize production in the 2010/2011 season has increased by 8 percent to 3,020,380 metric compared to the previous season. Overall, the country has recorded a surplus of 1,661,626 metric tonnes of maize. National maize production increased due to factors such as the increase in area planted to maize by the Small & medium scale sector. This in turn was partly a result of the increase in quantity of inputs distributed by Government and the resulting increase in the usage of hybrid seed by the Small & Medium Scale sector as well as the relatively timely distribution of inputs by Government. The country is also anticipated to record a surplus of wheat in excess of 88,000 metric tonnes. This is largely anticipated to be on the back of relatively high global wheat prices which have resulted in increased investment in irrigation capacity by the Large Scale Sector.

Despite the recorded success in production of crops such as Maize, Tobacco and Cotton, as well as the anticipated increase in wheat production, other key crops such as Groundnuts, millet, sorghum and sweet-potatoes have registered a decline in national output. Government remains committed to promoting crop diversification as a way of increasing food security and livelihood diversity in different parts of the country. To this end, Government has included rice as part of the input subsidy programme with other crops also under consideration for future support.

A. K. Banda (PMP)
Permanent Secretary

AGRICULTURE AND CO-OPERATIVES

1.0 Introduction

The Ministry of Agriculture and Cooperatives in conjunction with the Central Statistical Office are mandated to provide the country with estimates on crop production for each agricultural season. This information is used to provide a sound-planning base for the country's food security situation in a given year. In order to come up with this information, the Ministry of Agriculture and Cooperatives through the Agriculture Statistics and Early Warning Section, in collaboration with the Central Statistical Office, with technical assistance from the Food Security Research Project conducted the Crop Forecasting Survey (CFS) during the first and second quarters of 2011.

The production estimates that are generated are used to determine the National Food Balance Sheet. Information derived from the Survey is also used for, among other things, to measure the performance of the agricultural sector and its contribution to the country's Gross Domestic Production (GDP). The information from the CFS is further used as a tool to analyze the country's overall food availability and requirements in order to obtain an estimate of the food deficit or surplus situation. The Food Balance Sheet includes information on the country's Strategic Grain Reserve intentions for the season.

1.1 Purpose

- The crop forecasting survey obtains estimates from agricultural holdings on the area under major crops as well as production and sales estimates during the season. This information is used to assess the expected food security situation in the country and also to produce the National Food Balance Sheet (NFBS). The food balance sheet is used to determine the surplus or deficit situation of the country with respect to the major cereals

in the country. The information is vital to the private sector as well as donors and is useful for strategic planning and decision making purposes. Statistics generated from the survey must be measurable for their accuracy, comparable across time as well as comparable between different countries within the region. The Survey uses an internationally recognized methodology promoted by the FAO

Objectives of the Crop Forecasting Survey

- To provide Government with reliable, empirical annual crop production statistics for the agricultural season
- To generate the annual National Food Balance Sheet, which gives the National Food Balance
- To provide public institutions, the private sector and other stakeholders with National, Provincial and District level indicators of seasonal agricultural performance
- To provide statistics on the potential available marketable surplus for the major crops grown in the country
- To provide production statistics used for estimation of the agricultural contribution to the country's Gross Domestic Product (GDP).

2.0 Methodology

2.1 Scope and Coverage

Zambia is divided into the following administrative units; Province, District, Constituency and Ward with the ward being the lowest administrative unit in the country. The sample for the CFS is drawn from all the 72 districts of Zambia. For the purpose of sampling, the Central Statistical Office (CSO) has further

Census Supervisory Areas (CSA) and Standard SEA is the smallest area with well-defined boundaries identified on a census map. Each SEA contains approximately between 100 -150 households. A total sample of 680 CSAs is allocated nationally to each province and district proportional to its size (in terms of households). Twenty households are randomly selected from each of the 680 SEA's in the sample.

Table 1: Distribution of Enumeration Areas Selected for the CFS

Province	Number of CSA's Selected	Number of SEA's Selected
Central	62	62
Copperbelt	68	68
Eastern	106	106
Luapula	72	72
Lusaka	34	34
Northern	116	116
North-western	60	60
Southern	94	94
Western	68	68
Total	680	680

Note: One SEA is selected within each sampled CSA

2.2 Sample Selection

The primary sampling units (PSUs) were defined as the Census Supervisory Areas (CSAs) delineated for the census. The CSAs were stratified by district within each province and ordered geographically within each district. A master sample of CSAs was selected systematically with probability proportional to size (PPS) within each district at the first sampling stage; the measure of size for each PSU was based on the number of households listed in the 2000 Census. The

Standard Enumeration Area (SEA), defined as the segment covered by one enumerator during the census.

Only one SEA was selected within each sample CSA with PPS for the survey. Once an SEA was selected, an enumerator visited all the households within the SEA and collected basic information about the total area cultivated by the household as well as number of livestock and poultry raised. This information then forms the basis for stratifying a household as being agricultural or non-agricultural. For agricultural households further stratification categorizes them as Category A, B or C.

The first stage of field data collection involves obtaining a complete listing of basic demographic and agricultural information from all the households in the sampled SEA's. Information is collected on village name, name of household head, sex of household head, household size, whether the household planted any crops in reference period, total land under cultivation, whether the household planted any of a list of specified 'special crops' and number of Cattle, Goats, Pigs, Cattle & Chickens currently being raised by the household, After a process of stratification, twenty households are then sampled from each SEA for the detailed household interview. A stratified multi-stage sample design is used for the CFS. The current sampling frame being used is based on the mapping and data based on the 2000 Census of Population, Housing and

[Click Here to upgrade to Unlimited Pages and Expanded Features](#)

that the completion of the 2010 Census of Population and Housing will enable the generation of a new sampling frame of agricultural households for future surveys.

2.3 Sampling Frame

The frame of this survey is based on the 2000 Census of Population, Housing and Agriculture results; the frame was constructed by creating Crop Clusters in each district using Census Supervisory Area (CSAs) and Standard Enumeration Areas (SEAs) as geographical boundaries of the crop zones. The 2000 Census mapping exercise created approximately 16,000 SEA's nationally.

2.4 Sample Design

A three stage sampling procedure was used to select work areas and households for data collection purposes. At the first stage, CSAs were selected using Probability Proportional to Size (PPS) with agricultural households as a measure of selection.

At the second stage, SEAs were selected using the same procedure described above on the selection of CSAs. At the third stage, a count of households in selected work areas was conducted by listing all households resident in these areas before selection of sample households for data collection exercise. A Linear Systematic Sampling procedure (LSS) was used to select the required number of households in each EA.

2.5 Sample Size

A sample size of 680 SEAs were covered out of a total of approximately 16,000 SEAs in which the rural part of the country is demarcated. This means the survey represents 4.5 percent of the total number of SEAs. At household level, 20 households are covered out of a maximum total of 100-150 households per SEA.

percent of the total number of households in a

2.6 Data Collection

The survey covers three categories of agricultural households namely; Small-scale, Medium-scale and Large-scale farmers¹. Small and Medium scale farmers are covered on a sample basis. A fixed number of 20 households are canvassed in each selected SEA. A total of 13,600 (i.e. 680 x 20) agricultural households are covered for the small & medium scale. The Large-scale farmers are captured under a separate sub-survey under the CFS on a 100% enumeration basis. All entities cultivating more than 20 hectares of land and/or raising over 2,000 broiler chickens are classified as large scale farming holdings.

2.7 Data Processing and Analysis

After data collection, the questionnaires are sent to the provincial CSO headquarters for editing and data entry by data entry staff and supervisors from CSO and MACO. The edited questionnaires are entered using a software package known as CPro. The questionnaires and keyed in data are then transmitted to Lusaka for data cleaning. This involves consistency checks on the raw data using SPSS version 19 before the final weighted district estimates are produced. The survey period, from questionnaire design to data collection and analysis takes approximately 5 months. (See CFS work plan in appendix).

Table 2: Data Collection Staff

Data Collection Staff	Number participating
Small & Medium Master Trainers	18
Large Scale Master Trainers	2
Field Supervision Drivers	9
Field Supervisors	85

¹ A Small-scale household is defined as a household cultivating 4.99 hectares of crops or less. Households cultivating between 5 and 19.99 hectares of crops are classified as medium scale households. All households cultivating 20 hectares or more are classified as Large Scale farmers. For a detailed definition that includes Livestock and the cultivation of 'special crops', see the appendix.

	40
	340
Enumeration Team Drivers	85
Large Scale Drivers	2
Total Core team staff	681

2.8 Measurement Methodology

The CFS collects information on area planted for each crop, expected production and sales seed type, tillage method used, acquisition and usage of fertilizer etc. This information is based purely on farmer recall and estimation. The survey does not involve area measurement or direct field observation by the enumerator. No field visits are conducted. One of the reasons for relying on farmer recall and estimation is to reduce on measurement bias and error by the enumerator. The method used to collect household level data is the farmer recall method. Direct field observation by the enumerator also has significant cost implications which have generally not been commensurate with improvements in data quality. Loss of efficiency is avoided when the farmer recall method is used. Area expected to be harvested is also collected but is not used in the computation of yield. Only the area planted is used in yield computation. Yield is not calculated by the farmer but by the analysts at the data analysis stage. Yield is derived from quantity of expected production divided by the estimated area planted for each crop. All estimates are provided by the farmer.

3.0 Seasonal Weather Performance

The country experienced normal to above normal rainfall during the 2010/2011 season. There was late onset of effective rains in many parts of the southern region of Zambia. However, the country generally received enough rains to sustain good crop performance. The distribution of rainfall was also relatively good. For the period starting 1st October to 31st December 2010, the country received normal rainfall except for the northern-eastern areas of Nakonde, Isoka, Chama and Lundazi Districts as well as the south-western region of the country particularly Seheke and Kazungula districts which experienced below normal rainfall characterised by prolonged dry spells.

The second half of the rainfall season from 1st January to 31st March 2011 was characterized by above-normal rainfall across the country. Below normal rain was received in the Central and Lusaka provinces. Prolonged dry spells were also reported in February 2011, in Mkushi, Kapiri-Mposhi, Chibombo, Lusaka, Chongwe and Kafue Districts. This resulted in some crop moisture stress. The northern half of the country received above normal rainfall.

4.0 National Food Balance

The National Food Balance sheet for the 2011/2012 marketing season based on the crop forecasting survey covering 2010 to 2012 shows that the country has produced sufficient maize for both human consumption and industrial use. Total maize production in the 2010/2011 season has been estimated to be 3,020,380 metric tonnes. Maize carry-over stocks have been estimated at 848,606 metric tonnes.

Table 3: Carry-over stocks as at 1st May 2011

Source	Maize	Wheat	Rice	Sorghum & Millet
Farm Stocks captured by CFS (Large Scale and Small & medium)	129,968	50,844	564	3,700
FRA	626,252	-	3,647	
Millers Association of Zambia	66,366	21,007		
Grain Traders Association of Zambia	26,020	-	430	1,503

Most of this maize was in storage with the FRA as at 1st May, 2011. Private traders, Large Scale farmers as well as Small & Medium scale Farmers. When the maize carry-over stock from last season is added to the maize production for the 2010/2011 agricultural season the total supply of maize available for the 2011/2012 marketing season is 3,868,986 metric tonnes.

For an estimated population of 13.4 million people, the food balance sheet shows that total maize required for human consumption amounts to 1,396,341

maize requirement for industrial use, specifically 100,000 and 95,000 metric tonnes respectively. Post-harvest physical losses have been estimated at 5 per cent of current national production. Structural Informal cross-border trade estimates have also been factored into the balance sheet. A provision of 100,000 metric tonnes of maize has been made. This provision does not include formal exports out of Zambia.

When total maize requirements are netted out from total maize availability, a net surplus of 1,661,626 metric tonnes is estimated. Total maize requirements include anticipated government strategic reserve stock of **240,000** metric tonnes to be held by the Food Reserve Agency (FRA).

² Human staple food consumption represents 70% (1,470 kCal/person) from a total diet of 2,100 kCal/person/day (National Food and Nutrition Commission)

5.0 Crop Performance

5.1 Maize

Production of Maize, Soya-beans, Cotton, Irish potatoes, and Tobacco increased compared to the 2009/2010 season. Some important crops such as cassava, sorghum, millet, groundnuts and sweet potatoes registered a decline in area planted and expected production.

Total maize production in the 2010/2011 season was estimated to be 3,020,380 metric tonnes. The total area planted to maize by small and medium scale farmers increased by 10.9 percent or 128,983 hectares to 1,311,530 hectares from 1,182,547 hectares. Area planted to maize by large scale farmers has reduced by 26 percent from 59,721 hectares in the 2009/2010 season to 44,324 hectares in the 2010/2011 season.

Large scale farmers have achieved an average maize yield of 5.27 metric tonnes per hectare in the 2010/2011 season compared to 5.13 metric tonnes per hectare recorded in the 2009/2010 season

Small and medium scale farmers have achieved an average yield rate of 2.13 metric tonnes per hectare in the 2010/2011 season, compared to a yield rate of 2.10 metric tonnes during the 2009/2010 season.

5.2 Cassava

National cassava production for the 2010/2011 season has been estimated to be 1,132,156 metric tonnes of cassava flour equivalent, which is a reduction of 4.03 percent from the 2009/2010 season production of 1,179,657 metric tonnes.

...va for the 2010/2011 increased by 112 percent to 562 hectares from 264 hectares during the 2009/2010 season.

5.3 Rice

Rice production has been estimated to be 49,410 metric tonnes during the 2010/2011 season. This is a decrease of 4 percent compared to the production of 52,937 metric tonnes recorded during the 2009/2010 season.

The total area planted to rice for the 2010/2011 decreased by 5.15 percent to 33,995 hectares from 35,841 hectares during the 2009/2010 season.

5.4 Wheat

The wheat crop for the 2010/2011 season is currently being planted. However, estimates based on forecasted area to be planted indicate that the country is likely to attain production of 237,336 metric tonnes of wheat for the 2010/2011 season compared to 172,256 metric tonnes produced in 2009/2010. This represents a projected 38 percent increase in wheat production. The wheat production estimates will be updated by a specialized wheat survey to be conducted around September-October this year as the wheat crop becomes ready for harvest.

5.5 Sorghum & Millet

Sorghum production has declined by 33 percent to 18,458 metric tonnes in the 2010/2011 season from 27,732 metric tonnes in the previous season.

The total area planted to Sorghum for the 2010/2011 decreased by 21.6 percent to 26,854 hectares from 34,251 hectares during the 2009/2010 season.

ed by 22 percent to 37,644metric tonnes in the
metric tonnes in the 2009/2010 season.

The total area planted to millet for the 2010/2011 decreased by 25 percent to 42,663 hectares from 56,789 hectares during the 2009/2010 season.

5.6 Sunflower

Sunflower production has declined by 17 percent to 21,954metric tonnes in the 2010/2011 season from 26,420 metric tonnes in the 2009/2010 season.

The total area planted to sunflower for the 2010/2011 decreased by 25 percent to 40,894 hectares from 54,450 hectares during the 2009/2010 season.

5.7 Groundnuts

Groundnuts production has declined by 15 percent to 139,388 metric tonnes in the 2010/2011 season from 164,602 metric tonnes in the 2009/2010 season.

The total area planted to groundnuts for the 2010/2011 season decreased by 17 percent to 224,121 hectares from 268,803 hectares during the 2009/2010 season.

5.8 Soya-beans

Soya-bean production has increased by 4 percent to 116,539 metric tonnes in the 2010/2011 season from 111,888 metric tonnes in the 2009/2010 season.

The total area planted to soya-beans for the 2010/2011 season decreased by 1 percent to 61,422 hectares from 62,331 hectares during the 2009/2010 season.

increased by 68 percent to 121,908 metric tonnes in the 2010/2011 season compared to 75,386 metric tonnes in the 2009/2010 season.

The total area planted to seed cotton for the 2010/2011 season increased by 55 percent to 131,857 hectares from 85,073 hectares during the 2009/2010 season.

5.10 Irish potatoes

Irish potato production has increased by 20 percent to 27,563 metric tonnes in the 2010/2011 season from 22,940 metric tonnes in the previous season.

The total area planted to Irish potatoes for the 2010/2011 season increased by 27 percent to 1,806 hectares from 1,425 hectares during the 2009/2010 season.

5.11 Virginia tobacco

Virginia tobacco production increased by 23 percent to 27,146 metric tonnes in the 2010/2011 season from 22,074 metric tonnes in the 2009/2010 season.

The total area planted to Virginia tobacco for the 2010/2011 season increased by 26 percent to 15,080 hectares from 11,984 hectares during the 2009/2010 season.

5.12 Burley tobacco

Burley tobacco production has increased by 715 percent to 8,878 metric tonnes in the 2010/2011 season from 1,089 metric tonnes in the 2009/2010 season.

The total area planted to burley tobacco for the 2010/2011 season increased by 17 percent to 10,122 hectares from 8,618 hectares during the 2009/2010 season.

declined by 28 percent to 47,070 metric tonnes in the 2010/2011 season from 65,265 metric tonnes in the 2009/2010 season.

The total area planted to mixed beans for the 2010/2011 season decreased by 16 percent to 71,544 hectares from 85,177 hectares during the 2009/2010 season.

5.14 Sweet potatoes

Sweet potato production has declined by 42 percent to 146,614 metric tonnes in the 2010/2011 season from 252,867 metric tonnes in the 2009/2010 season.

The total area planted to sweet potatoes for the 2010/2011 season decreased by 36 percent to 45,335 hectares from 70,755 hectares during the 2009/2010 season.

5.15 Paprika

Paprika production has declined by 12 percent to 600 metric tonnes in the 2010/2011 season from 533 metric tonnes in the 2009/2010 season.

The total area planted to paprika for the 2010/2011 season decreased by 17 percent to 302 hectares from 363 hectares during the 2009/2010 season.

5.16 Barley

Barley production, which is relatively new in the country, is projected to increase to 8,878 metric tonnes in the 2010/2011 season from the 1,089 metric tonnes that was first reported in the 2009/2010 season.

...ay for the 2010/2011 season increased by 568
...81 hectares during the 2009/2010 season.

5.17 Popcorn

Popcorn production has declined by 44 percent to 4,408 metric tonnes in the 2010/2011 season from 7,846 metric tonnes in the 2009/2010 season.

The total area planted to popcorn for the 2010/2011 season decreased by 42 percent to 3,275 hectares from 5,597 hectares during the 2009/2010 season.

6.0 National Crop Production Tables

Table 5: Area planted Estimates based on the 2010/2011CFS

Crop	Area planted (ha)		
	2009/2010	2010/2011	
Maize	1,242,268	1,355,764	9
Maize (for seed)	6,328	13,922	120
Maize (for silage)	1,608	2,012	25
Green Maize		612	
Sorghum	34,251	26,854	(22)
Rice	35,841	33,995	(5)
Millet	56,789	42,663	(25)
Sunflower	54,450	40,894	(25)
Groundnuts	268,803	224,121	(17)
Soyabeans	62,331	61,422	(1)
Cotton	85,073	131,857	55
Irish potatoes	1,425	1,806	27
Mixed beans	85,177	71,544	(16)
Bambara nuts	6,375	5,750	(10)
Cowpeas	6,416	2,089	(67)
Sweet potatoes	70,755	45,335	(36)
Cassava	403,302	387,062	(4)
Paprika	363	302	(17)
Wheat	27,192	37,637	38
Barley	181	1,206	568
Popcorn	5,597	3,275	(41)

Note: 2010/2011 CFS is the first time statistics for Barley and Popcorn are being collected

Table 6: Area expected to be harvested and Percentage change based on the 2010/2011 CFS by crop (national)

Crop	Area to be harvested (ha)		
	2009/2010	2010/2011	% change
Maize	1,080,558	1,101,785	2
Maize (for seed)	6,284	13,765	119
Maize (for silage)	1,545	2,007	30

8.0 Appendix

CFS 2010/2011 District Summary Tables Can be obtained Online from
www.maff.gov.zm or www.zamstats.gov.zm

Categorization of Households

Medium Scale Households

Category C: Area under crops 5.0 – 19.99 ha. This category will also include:

1. Households reporting any of the specified crops when only 1 or 2 households in the SEA report the specified crop(s), even if they do not qualify basing on area under crops.
2. Households raising 50 or more cattle, 20 or more pigs, 30 or more goats, and/or 50 or more chickens, even if they do not qualify basing on area under crops.

Small Scale Households

Category B: Area under crops 2.0- 4.99 ha. This category will also include households reporting any of the specified crops, when 3 to 5 households in the SEA report the specified crop(s), even if they do not qualify basing on area under crops.

Category A: All the remaining agricultural households with area under crops less than 2.0 hectares
